Modernization of Minatori Through Advanced Wood-Drying Technology

A professional company catalog presenting how the new drying kilns, supported by CNVP and the Embassy of Sweden in Prishtina, are helping Minatori work faster, protect material quality, and organize production more efficiently.

Crafting wood with passion and precision

From Traditional Craftsmanship to a Stronger Production Model

Minatori is a wood-processing company dedicated to transforming natural wood into durable, functional, and refined products. Built on experience, precision, and respect for material, the company develops customized solutions for residential and commercial use, including doors, stairs, kitchens, tables, chairs, and other tailored wood elements.

This modernization is not only about installing equipment. It is about creating a stronger production foundation, improving internal workflow, and preparing the company for more reliable and competitive growth.

Today, Minatori is moving into a more modern phase of development. The introduction of advanced wood-drying capacity strengthens one of the most important stages in production and creates better conditions for efficiency, quality control, and long-term growth.

Around 2-3 years to dry

Previous drying time

Before modernization, natural drying occupied time, storage, and production planning capacity.

Now we dry in 25 days

Current drying time

Wood now dries in a controlled kiln cycle instead of requiring months of natural drying.

Internal pests reduced

Cleaner wood preparation

Kiln drying helps eliminate internal wood insects such as woodworms and improves material readiness.

More free workspace

Operational improvement

Faster drying releases valuable work area and supports cleaner internal organization.

A stronger production system begins with better preparation of the material.

PARTNERSHIP AND INVESTMENT

A Meaningful Investment in Minatori's Development

Another important aspect of this investment is its support for small family businesses in the region.

Through affordable drying services, Minatori helps local woodworkers dry their timber professionally while also eliminating insects and moisture related damage.

The company currently cooperates with four local clients who benefit directly from this process. Furthermore, in the Prizren region there is currently no other industrial drying kiln of this kind.

This facility, made possible through the support of CNVP and Sweden Sverige, represents a unique and valuable resource for the local wood processing sector.

Strategic value of the investment

Faster production cycles
Wood can be prepared in weeks instead of months.

Better material readiness
Controlled drying supports more consistent processing conditions.

Cleaner workspace flow
Less long-term storage pressure improves internal organization.

Stronger future capacity
The company can plan work more reliably and respond more quickly.

WOOD DRYING TRANSFORMATION

From Natural Drying to Controlled Kiln Drying

The clearest result of the new donation is the change in how Minatori prepares wood before it enters production.

Before - natural drying

- Wood often needed around 2/3 years to dry naturally.
- Storage and work areas remained occupied for long periods.
- Production planning was slower and less predictable.
- Internal pests and woodworms could remain inside the material.

After - controlled kiln drying

- Drying now takes approximately 25 days.
- The process is more controlled, faster, and easier to schedule.
- Kiln drying helps reduce internal pests such as woodworms.
- Space is released for better organization and smoother workflow.

Around 25 days instead of around 2/3 years

A shorter drying cycle means faster movement from raw timber to usable production material.

Shorter Drying Time, Faster Production Flow.

2025

The increase in staff was driven by growing market demand and the expansion of production capacities. As a result of investments and improved organization of the wood drying and processing operations, the company has recorded continuous growth in employment.

2026

Improved product quality, expansion of the client base, and increasing market demand have contributed to the creation of new jobs. The investment in the industrial drying kiln has enabled more efficient processing and better production planning.

2027

The continuous growth in demand, expansion of client partnerships, and development of production capacities have contributed to the increase in the number of employees. The company plans to further increase production and improve services within the wood processing sector.

2028

The expected increase in production capacity, broader market reach, and continuous improvement of services are anticipated to support the creation of additional jobs. The company aims to strengthen long term business sustainability and further development.

This investment is expected to contribute to a **250%** increase in demand and sales by **2028**

QUALITY AND MATERIAL PROTECTION

Cleaner Material and Better Preparation for Production

An important advantage of the new kilns is the reduction of internal wood pests, including woodworms and similar insects. This helps make the material cleaner, safer, and better prepared for long-lasting use.

More controlled drying also supports improved stability, greater confidence in finishing, and better overall quality in the final product.

Cleaner wood preparation

Kiln drying helps reduce internal pests and improves the condition of the material before production.

Better durability

More controlled preparation supports stronger performance in the final wood product.

Improved finishing readiness

More stable material makes later processing steps cleaner and more dependable.

Higher quality confidence

The team can work with better consistency and clearer expectations at each stage.

Controlled drying protects both the material and the quality of the finished result.

WORKSPACE AND OPERATIONAL IMPACT

More Free Workspace, Better Organization, Stronger Output

The new kilns have also helped release valuable working space. When wood had to dry for long periods, storage areas remained occupied and production flow was restricted. With the new system, material moves through the process faster, creating a more functional and organized workspace.

This improvement supports cleaner handling of raw material, smoother internal logistics, and a more professional working environment. In practical terms, the donation strengthens Minatori's efficiency today while also creating better conditions for future expansion and stronger market positioning.

Freed workspace

Long drying periods no longer occupy as much valuable area inside the production environment.

Cleaner workflow

Material moves more smoothly from storage to preparation and into production.

Better internal organization

The team can plan work more clearly and operate with less congestion.

Stronger competitiveness

Faster cycles and better quality help Minatori respond more professionally in the market.

The donation improves not only speed and quality, but also the way space and work are managed.

THANK YOU

With special appreciation, we thank **CNVP** and the **Embassy of Sweden in Prishtina** for their valuable support. This contribution has helped **Minatori** modernize a key part of its wood-processing operation and has created direct improvements in efficiency, quality, and working conditions.

The new drying kilns represent more than equipment; they represent progress. They shorten drying time, help protect the material, release workspace, and support a more sustainable and professional production model for the future.

Crafting wood with responsibility, quality, and a stronger vision for tomorrow.

This catalog highlights the impact of modernization through advanced wood-drying technology and the role of partnership in strengthening Minatori's future.
